

Make Gardening Simple With Empire Pots

When it comes to gardening, fabric beats wood every time. Using cloth instead of wood when building a raised bed will be easier, safer, and give you healthier and more robust plants.

If you have never used a raised fabric bed before, you will be surprised by how lightweight it is while still being incredibly sturdy. Empire Pots fabric raised beds are sewn with a triple hem and bottom seams to the outside to help keep both the PVC framing and material in good working order.

You won't need to worry about chasing after errant screws and nails or need any carpentry skills to assemble your new fabric raised beds, either.

The Advantages of Using a Fabric Raised Bed

Fabric raised beds are fantastic to grow in. They are safe, convenient, and grow healthier plants. They are not only practical, but offer an economic and easy-to-assemble solution for simple gardening at home.

Here are a few more advantages that you can expect when you choose to grow your plants in fabric raised beds:

Lots of Room: Many people have made the switch to fabric raised beds instead of using pots because it gives them so much more growing room.

Better Soil Microbiology: Thriving microbiology can be very hard to maintain in smaller pots or wooden structures. A fabric raised bed provides optimum conditions, including maintaining moisture, for valuable microbes to flourish.

Promotes Aeration: Your plants will grow larger and stronger because they have better and stronger roots. This is because growing in a fabric raised bed, as opposed to a wooden raised bed or fabric pots, allows for more oxygen to circulate around the roots of the plants.

Conserves Water: Anytime you have a larger soil mass, you will have a higher rate of water retention. This means that using a fabric raised bed will take far less water than using many smaller pots would.

Better and Larger Yields: Having more room for roots to grow, in combination with better aeration and soil conditions, will produce healthier and larger yields using a fabric raised bed as opposed to using smaller fabric pots or a wooden-raised bed.

Fewer Materials and Labor: Plants grown together in a raised fabric bed tend to have a shared root system that helps them grow and stay healthy on their own, which means less maintenance and care is needed for the plants. It is also true that when you use smaller pots, at some point, repotting is inevitable and will come with a cost and involve a good bit of labor.

Light Weight and Moveable: Fabric raised beds are made with fabric and PVC piping. This means that they are actually really lightweight and can even be moved with soil in them! That is not possible with a wooden raised bed, and moving numerous pots takes a lot of time and effort.

Safe and Easy: The best thing about fabric raised beds is that they are completely safe. They don't have sharp corners, give splinters, or have errant nails. In fact, a fabric raised bed can even be suitable for ADA needs because of its accessibility.

Mycelium Network: When plants are grown together, such as those in a raised fabric bed, they create their own mini-ecosystem and share a soil and root system. This type of shared system lets them come together to share moisture and nutrients as well as fight and stave off disease.

Living Soil and No-till Growing: Because of how fabric raised beds maintain their levels of moisture and support healthy soil microbiology, they are a perfect setting for living soil and no-till growing.

What Makes Our Fabric Raised Beds So Special?

All of the materials used to make our fabric raised beds are BPA-free and made right here in the United States. We use 1 inch PVC piping for the frames of the fabric raised beds, which makes them significantly more sturdy than other growing structures that are made from half-inch PVC piping. Our fabric raised beds are so tough and durable that they can be reused for many growing cycles or seasons, depending on how you choose to use them.

Assembling Your Fabric Raised Bed

Assembling your fabric raised bed is easy. It doesn't take any special skills or equipment. When you get your fabric raised bed, you will receive the fabric for the bed itself along with all of the needed PVC fittings.

You will not receive the one-inch PVC pipes to connect the bed or build your trellis. You will need to purchase the appropriate lengths of one-inch PVC pipe from your local hardware or home goods store to finish creating the bed.

Building a Trellis

Included with the materials to build your fabric raised bed, you will find PVC fittings you can use to attach a trellis. You will be able to adjust the trellis to any height you wish, by purchasing pieces of one-inch PVC pipe at the appropriate lengths. The trellis is not necessary, but is a great addition and option, especially if you choose to grow vining plants.

Why Choose a Fabric Raised Bed?

A fabric raised bed is easy to build and will give you a healthy and versatile place to grow plants. It is easy to get the whole family involved in this type of gardening because it is fun and easy to access. The amazing environment created by the fabric raised bed will produce large beautiful yields that are exciting for both new and experienced gardeners alike.

You will love gardening when you opt for fabric raised beds. You can customize their height and even add a custom trellis to house different plants with different growing needs. See what all the buzz is about! Choose a fabric raised bed and get growing today!
