

Do you offer different styles of metal buildings?

[Brand Name] is the #1 dealer of metal buildings in the country. We are proud to offer you a wide variety of buildings to choose from to meet all of your building needs. Metal buildings come in a great range of styles, including metal carports, metal garages, metal barns, metal building homes, commercial metal buildings, clear span buildings, metal workshop buildings, and metal warehouses.

What difference does the gauge of the steel make?

Gauge measures how thick a piece of metal is. [Brand Name] offers both 12 and 14 gauge steel framing. Both will provide a durable and robust structure that you can use safely for years to come. We offer 14-gauge steel framing, which is the norm across the industry and is our more budget-friendly option. 14-gauge steel framing is very strong, will get the job done, and will last for years to come. 12-gauge steel framing has a smaller diameter which gives it higher tensile strength. This is why we recommend 12-gauge steel framing for regions that face heavier snowfalls and higher wind speeds, as well as for carports.

How soon will my building be installed?

[Brand Name] has the quickest lead times in the metal building industry. We value your time, so we strive to get our buildings delivered and installed as quickly as possible. In general, we can have your structure delivered to your property and installed just 4 to 6 weeks after you place your order.

Are metal buildings customizable?

One of the best features of metal buildings is how customizable they are. There are so many different ways you can alter a metal building to meet your exact needs. [Brand Name] offers a great variety of choices in building sizes and colors. There are many styles of roofs, windows, and doors that provide both functional and aesthetic features. You even have options in anchors and certifications.

How do I prepare my site for my metal building to be installed?

The most critical aspect of site preparation is to ensure that your land is level. If your ground is not level or has poor quality soil that will be unable to adequately support the building, you may need to consider having a foundation installed. The experts at [Brand Name] will be able to advise you of any of these considerations.

Does a metal building require a building permit?

Many local governments require building permits for the installation of buildings over 120 square feet. You should consult your local building department for information regarding requirements for permits for metal buildings. This is especially important when an installation requires engineering and foundation work to be completed as well. Not obtaining the correct building permits can result in unwanted fines and unnecessary legal challenges.

What makes a steel building certified?

To be considered certified, a professional will design and engineer the building specifically to withstand established industry ratings for wind speed and snow loads. It is common for localities that require building permits for metal buildings to require that the metal buildings being installed are certified as well.

Even if a certification is not required, having a certified metal building is a good idea because certified facilities come with better engineering and support, such as additional braces, screws, and anchors that uncertified buildings do not come with. [Brand Name] can provide you with the best-certified buildings on the market.

Can I purchase a metal building kit from you?

Yes. [Brand Name] has an abundance of metal building kits for you to choose from. When you purchase one of our metal building kits, you will get all of the tools, materials, and accessories that you need to start building your structure immediately. You won't have a long wait or have to hire professionals to help. You can make this a purely DIY project and still rest assured that you have a top-quality building made from the very best materials.

How are pre-engineered buildings priced?

There is no specific answer to this question. There are so many variables and options available when it comes to metal buildings that it is not possible to give one specific general price. Specific building codes in your area may require a particular gauge of steel frame or a certain number of doors or windows, and these things will all affect the price. How long, wide, and tall your building is will also play a role in determining the price. Unique design features and accessories may add to the cost as well. Beyond these costs, outside expenses may be added, such as permitting fees, excavation, site preparation, and utility hookups.
