

# Secure and private by design, from day one

Hive was built with security in mind from the beginning. Independent firm Kudelski Security confirms that our products are completely safe for customers. Protecting customers' devices and data remains our highest priority.

## Zero access to your content

Hive cannot view your video content and captures only network and playback metadata. Hive's storage of PII is minimal and fully protected, meeting the standards of GDPR. Customers have the choice to obfuscate that information if necessary or prevent the capture of such data.

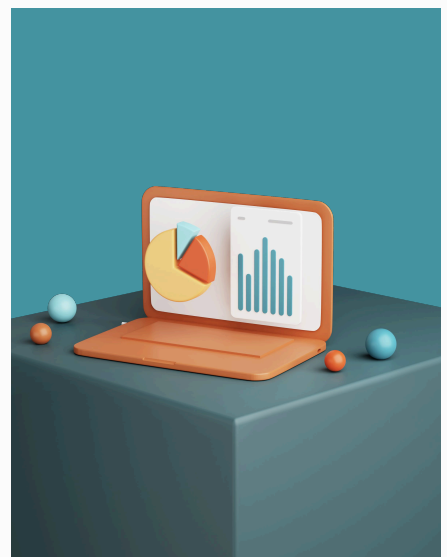

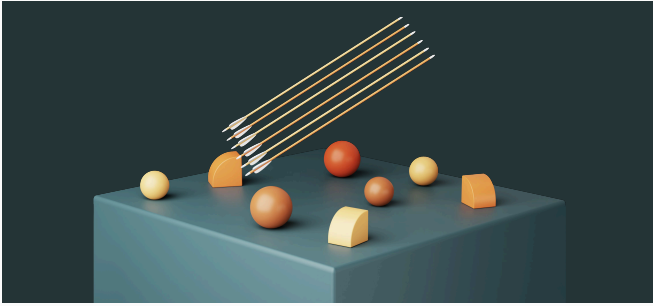

## Hardened software

Hive follows industry standards for the entire secure software development life cycle, including threat modeling, security code review, security scanning and dependency vulnerability checking tools.

## What sets Hive apart

- Hive has no access to your video content
- Only minimal PII and video data pass through our backend
- Secure development with threat modeling, pre-release code reviews, and secure deployment
- 24/7 production monitoring to detect and eradicate potential attacks
- Dedicated in-house security team
- Dual European data centers keep the Hive backend physically safe on Microsoft Azure cloud servers
- Hive is the only European provider with full legal liability under EU law, and complies with all US regulations

## Defense in depth

Sensitive assets are protected by multiple security mechanisms and controls, so that data remains secure even if a single security layer becomes compromised.

## Backed up in two secure facilities

Our backend is secured in two physically separate data centers in Europe run by Microsoft Azure to eliminate the possibility of data loss. Azure carries 90+ industry-leading compliance offerings.

security incidents

### PRODUCT & ORGANIZATIONAL SECURITY

## No known security incidents

Hive has an excellent track record and works with trusted external firms to ensure continuous improvement. 4 million Hive Agents are installed across multiple security-sensitive customer organizations, with no incidents recorded to date.

### PRODUCT & ORGANIZATIONAL SECURITY

## Proven security, backed by experts

Hive works with external security firms to ensure **product and organizational security**. EY has performed an audit according to International Assurance Standard ISAE 3000, focusing on the operational parts of the SOC2 framework.

Every year, Hive conducts a thorough external assessment of all relevant systems. In 2020, the reputable Swiss security firm **Kudelski** conducted an in-depth review of twenty focus areas within Hive, including the Hive Agent, P2P distribution, Hive Analytics, Silent Testing, data collection and privacy, endorsing Hive's security.

“We rate the technical information security risk of the Hive product suite as low and found that Hive demonstrated high maturity in their security practices, development practices, privacy practices, and overall security by design methodology.”

Affirmed by Kudelski Security.

## Hive complied with GDPR before it existed

We built Hive to protect enterprise and end-viewer information from the very beginning, making us GDPR-compliant long before the regulation went into effect.
