

CLIMATE CRIMINALS

How the high-flying lifestyles of the rich and famous impact our environment. Sources from: Yard Digital, the FAA, PR Newswire, Triumph Jets, and Statista.

Celebrities love their private jets. In fact, they might love them **a little too much**. A study by Yard Digital found that several popular musicians, artists, and athletes were among the top CO² producers in aviation this year.

Celebrities and other private jet owners might have a genuine need for private jets — after all, what if they need to make it to important events, meetings, or concerts on time?

However, a survey by PR Newswire asked private jet owners and renters why they charter their jets and found that most private jets are used **primarily** or **exclusively** for pleasure.

According to data from Yard and Statista, celebrity “climate criminals” take dozens of short flights every year — and their carbon output is over **482 times that of the average person**.
