

Is Testosterone Cypionate Cypionate - Test-C 300 mg

Test-C is an oil based solution of Testosterone Cypionate for IM injection designed to release Testosterone slowly from the injection site.

- Product: Test-C 300 mg 1 ml
- Category: Injectable Steroids
- Ingredient: Testosterone Cypionate
- Manufacture: Magnum Pharmaceuticals
- Qty: 10 amps
- Item price: \$5.94

Quero viver uma música que me dê vontade de chorar, que emocione o meu coração. Não porque ela seja triste, mas porque o amor ressoa em cada nota. A gente busca, busca e busca a perfeição nessa vida. Até que um dia aprende a olhar para o céu, deitado sobre a grama, sem se importar com o passar do tempo e percebe que a perfeição é tudo isso que nos rodeia. Hoje eu quero alguém que me cante mesmo desafinado. Que tenha a mesma pressa que eu tenho em amar. Quero alguém sedento por viver.

Clinical Trials Update

Physical Therapy Outperforms Injections for Knee Osteoarthritis

Physical therapy reduced pain and functional disability more effectively than glucocorticoid injections among patients with osteoarthritis of the knee, a trial in the *New England Journal of Medicine* reported.

The study's 156 patients in the US Military Health System were randomized to receive up to 3 glucocorticoid injections or a maximum of 14 physical therapy sessions over 12 months. The primary outcome was the total score on the Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC). The scores range from 0 to 240, with higher scores indicating worse symptoms.

In the glucocorticoid injection group, the average WOMAC score declined to 55.8 from a baseline of 108.8 and to 37.0 in the physical therapy group from a baseline of 107.1. Both groups achieved the minimum clinically important difference of 12% improvement from baseline.

C-Reactive Protein Test Reduces Antibiotics for COPD Flare-ups

In a recent UK trial, use of a C-reactive protein (CRP) point-of-care test to guide treatment decisions reduced antibiotic use among patients with acute exacerbations of chronic obstructive pulmonary disease (AECOPD). Previous research suggests that CRP levels correlate with antibiotic efficacy among patients with AECOPD.

The study's 649 patients with an AECOPD were randomly assigned to a CRP test plus usual care or to usual care alone. In the 4 weeks after randomization, 77.4% of the usual-care group took antibiotics compared with 57% of the CRP test group. Clinicians said they valued the CRP test but that the time and costs associated with it "needed careful consideration," the investigators wrote in *Health Technology Assessment*.

Prostate Cancer Drug Degarelix Rapidly Treats Pedophilic Disorder

Degarelix, an advanced prostate cancer drug, rapidly reduced the risk of committing child sexual abuse among men with

pedophilic disorder, a phase 2 trial in *JAMA Psychiatry* found.

The study involved 52 men in Sweden who were diagnosed with and seeking treatment for pedophilic disorder. They were randomly assigned to receive either 2 subcutaneous injections of degarelix acetate or a placebo.

At 2 weeks, the composite risk score of 5 domains of child sexual abuse (range, 0-15 points) decreased from 7.4 to 4.4 among participants in the degarelix group and from 7.8 to 6.6 in the placebo group. A decrease in risk score was also seen at 10 weeks in the treatment group.

Degarelix is a gonadotropin-releasing hormone antagonist that decreases testosterone to castration levels within 3 days without initial testosterone flare-ups seen with similar drugs. With further study, the fast-acting drug plus psychosocial support may be suitable for long-term treatment, the authors noted.

Plant Extracts May Relieve Hangover Symptoms, Trial Suggests

A dietary supplement drink containing plant extracts improved hangover symptoms after moderate alcohol consumption in a trial published in *BMJ Nutrition, Prevention & Health*.

The trial randomly assigned 214 participants in Germany to 3 groups. One group received a flavored drink with plant extracts, vitamins and minerals, and glucose. A second group's drink excluded the plant extracts, and the placebo group's drink had only glucose. Participants drank the solutions before and immediately after they consumed beer or white wine.

Only the drink with plant extracts significantly lessened symptoms, reducing headache intensity by 34%, nausea by 42%, feelings of indifference by 27%, and restlessness by 41% compared with placebo. In addition, alcohol consumption did not cause substantial dehydration in the study, suggesting that electrolyte and mineral loss may be negligible hangover contributors.

Hangover symptoms are predominantly caused by alcohol and its metabolites, and plant extracts may reduce their severity, the authors wrote.

Physical therapy relieved pain and disability from knee osteoarthritis more effectively than glucocorticoid injections in a recent clinical trial.

Clopidogrel Noninferior to Ticagrelor With Less Bleeding

Among older patients with acute coronary syndrome, platelet inhibition with clopidogrel significantly reduced bleeding risk without increasing thrombotic events compared with ticagrelor, a noninferiority trial in *The Lancet* reported.

The trial involved 1002 patients in the Netherlands, aged 70 years and older, who continued to receive standard care for non-ST-elevation acute coronary syndrome. They were randomly assigned to a loading dose of clopidogrel or ticagrelor followed by a maintenance dose of 75 mg clopidogrel once daily or 90 mg ticagrelor twice daily. (The 5% of participants who received prasugrel were included in the ticagrelor analysis.)

At 12 months, 18% of patients in the clopidogrel group experienced bleeding that required medical attention compared with 24% in the ticagrelor group. The composite net clinical benefit—a combination of all-cause death, myocardial infarction, stroke, and major or minor bleeding—was noninferior for clopidogrel (28%) vs ticagrelor (32%). Among patients in the ticagrelor group, 47% prematurely discontinued the study drug compared with 22% in the clopidogrel group. Bleeding, dyspnea, and need for oral anticoagulation were the primary reasons patients left the study. — **Anita Slomski, MA**
