

Assignment no: SDMT-1
File name: Medical Transcript
Duration: 00:02:14

SUBJECTIVE: The patient is a 49-year-old white female, established patient of Dermatology, last seen in office on 08/10/2004. She comes in today for reevaluation of her acne, plus she has had what she calls a rash for the past two months now on her chest, stomach, neck, and back. On examination, there is flaring of her acne with small folliculitis lesions. The patient has been taking amoxicillin 500 mg b.i.d. and using Tazorac cream 0.1. Her face is doing well, but she has been out of her medication now for three days also. She has been getting photo facials at Healing Waters. I was wondering about what we could offer as far as cosmetic procedures and skin care products, etcetera. The patient is married. She is a secretary.

FAMILY, SOCIAL, AND ALLERGY HISTORY: She has hay fever, eczema, sinus, and hives. She has no melanoma or skin cancers or psoriasis. Her mother had oral cancer. The patient is a nonsmoker. No blood tests. She had some sunburn in the past. She is on benzoyl peroxide and Daypro.

CURRENT MEDICATIONS: Lexapro, Effexor, Ditropan, aspirin, and vitamins.

PHYSICAL EXAMINATION: The patient is well developed and appears stated age. Overall health is good. She has a couple of acne lesions, one on her face and neck, but there are a lot of small folliculitis-like lesions on her abdomen, chest, and back.

IMPRESSION: Acne with folliculitis.

TREATMENT:

1. Discussed condition and treatment with the patient.
2. Continue amoxicillin 500 mg two at bedtime.
3. Add Septra DS every morning with extra water.
4. Continue Tazorac cream 0.1. It is okay to use on back and chest also.
5. Referred to ABC Clinic for anesthetic consult. Return in two months for a followup evaluation of her acne.
