

This is Fine

Turtles, dolphins, other fish

Swimming in the ocean, doing as they wish

What's that? A tasty snack?

A bite of algae, nothing's wrong with that

A crustacean? Mmmm. A plastic bead? Go ahead.

Could eating plastic really leave you dead?

1 in 3 fish go ahead, eating beads, small in size

Plastics make a hundred thousand fish meet their demise

The Great Garbage Patch, epitome of waste

Twice the size of Texas, caused by the human race

Among billions of sea life lies this landmine

Plastic products probably outnumber those that thrive

8 million tons, every year

Thrown into the ocean, without a fear

Millions killed, does nobody care

'Bout a non-biodegradable nightmare?

Only 10% of plastics are renewable,

So this problem could be fixable, but

Everything is fine.

Polar bears, seals, in the far north
Thriving in the tundras without much warmth
Living in the ice caps, feeding off of fish
In the 20 thousands, populations flourish

Machinery buzzes like an insect, softly
Smoke billows like a volcano from a factory
Greenhouse gases become less rare
As carbon dioxide pollutes the air
Ocean temperatures slightly rise
Warmer water melts more ice

4 billion tons in 2020
From greenhouse gases, more than plenty
Other methods could be used
Solar, wind, to name a few
150 species go extinct daily
Less CO2 will decrease this, most likely, but
This is fine.
