

Reservoir Labs provides technologies and contract R&D services to the computer industry, government, and business end users. Our focus is on assuring the productivity of users of high performance computers for embedded, scientific, and business applications. We have particular expertise in optimizing compilers, network processing, and software verification in these markets, embodied in a suite of products for research and end-user use. [see less](#)

Service Overview

We have a track record of successfully developing advanced compilers for specific application domains as well as for novel computer architectures. These can be full custom compilers with novel optimizations or retargetings of standard or open source compilers such as LLVM and gcc. Reservoir also applies compiler technology in novel ways to application domains, software verification, and network processing.

R-Check SCA

[Recommend](#)

Product Overview

Fast, Accurate, Repeatable SCA Compliance Testing

R-Check® SCA is a version of R-Check customized to satisfy the requirements for Software Communications Architecture (SCA) compliance testing. The SCA is an open architecture framework that governs the structure and operation of the US Military's Joint Tactical Radio System (JTRS) and is gaining momentum in the civilian and international government sectors as a guiding path for software radio development. For the US Military, the JTRS Test & Evaluation Lab (JTEL) acts as the test authority for compliance testing of the SCA and is charged with developing and maintaining that testing capability. The SCA references both the IEEE POSIX® and OMG CORBA® standards, placing restrictions on the use of POSIX operations and the structure, definition, and operation of CORBA components. R-Check SCA parses the full ANSI C and C++ languages (including preprocessor emulation), CORBA® middleware IDL, and SCA XML descriptor files, enabling total code analysis for SCA 2.2 and 2.2.2 projects. For all files, compliance checking is performed with complete awareness of the code structure and context.

- Built-in SCA 2.2 and 2.2.2 support
- Static analysis
- Automatic configuration
- Flexible reporting formats
- Partial Code Mode (PCM)
- Commercial compiler front end
- Modular components

R-Scope® Network Security

[Recommend](#)

Product Overview

Reservoir Labs' R-Scope® is a next generation network security monitor that empowers cyber-security analysts and operators with the vital situational awareness and threat intelligence necessary to combat today's advanced cyber attacks. R-Scope employs and extends the state-of-the art Bro analytics language, empowering analysts to develop custom network security analytics tailored to their environment. This approach provides a degree of attack discrimination that is beyond the reach of traditional, signature-based IDS systems. R-Scope Network Security Appliances are scalable, agile building blocks for deploying real-time threat detection and network monitoring solutions scaling to 100 Gbps and beyond. Unlike stove-piped proprietary products or roll-your-own open source solutions, R-Scope's pre-configured, tested, tuned, and fully supported appliances easily integrate into existing network security infrastructures for rapid deployment.

- Scalable
- Efficient
- Intelligent
- Visualization and Integration

R-Stream High-Level Compiler

[Recommend](#)

Product Overview

A new class of multicore processors and accelerators has emerged with significant parallelism and on-chip distributed memory (e.g., GPGPU) that requires explicit control and communication among tiled computation kernels. This new class of computation devices offers over a 10x improvement in power efficiency, but can be 100x more difficult to program. R-Stream is a "High Level Compiler" for embedded computing and parallel processing and HPC algorithms, and is designed to seamlessly generate parallelized code to target-specific (low-level) C compilers. Specifically, R-Stream is a source-to-source compiler that accepts a sequential C program as input and produces code that has been parallelized and optimized for these new types of processors. R-Stream can output optimized code in a variety of formats for downstream processors, including highly optimized OpenMP and CUDA.
