

Are you at risk for breast cancer?

Today – We'd Like to Help Protect You from Breast Cancer

While an estimated 85 percent of those diagnosed with breast cancer have no significant family history of the disease, some families do have a hereditary cancer syndrome that increases their risk of cancer.

Your personal risk of breast cancer may be higher if you:

- Had your first menstrual period before age 12
- Have no children or had your first child at age 35 or later
- Entered menopause after age 55
- Have dense breast tissue
- Have received hormone therapy for five years or more
- Have had multiple breast biopsies
- Have had a breast biopsy showing atypical cells
- Have previously had breast cancer
- Have had radiation treatment of the chest area
- Have a mother, sister, paternal aunt or grandmother diagnosed with breast cancer at any age

Your family members or you may face a higher risk of breast cancer if:

- A blood family member was diagnosed with breast cancer before age 50
- A blood male family member was diagnosed with breast cancer at any age
- Multiple family members were diagnosed with breast cancer
- You are of Ashkenazi Jewish heritage
- A blood family member was diagnosed with ovarian cancer
- You or a family member had triple negative breast cancer
- You or a family member had breast cancer and pancreatic cancer

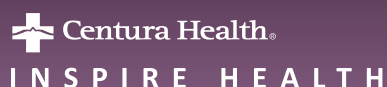

We help women at higher risk for breast cancer manage their breast health.

The specialists at Centura Health Breast Care work closely with women to help them identify and respond appropriately to their breast cancer risks. The most advanced imaging is used to support diagnosis and treatment, and certified genetic counselors can provide counseling and testing information when hereditary cancer risks are a concern.
