

Space for Simplicity

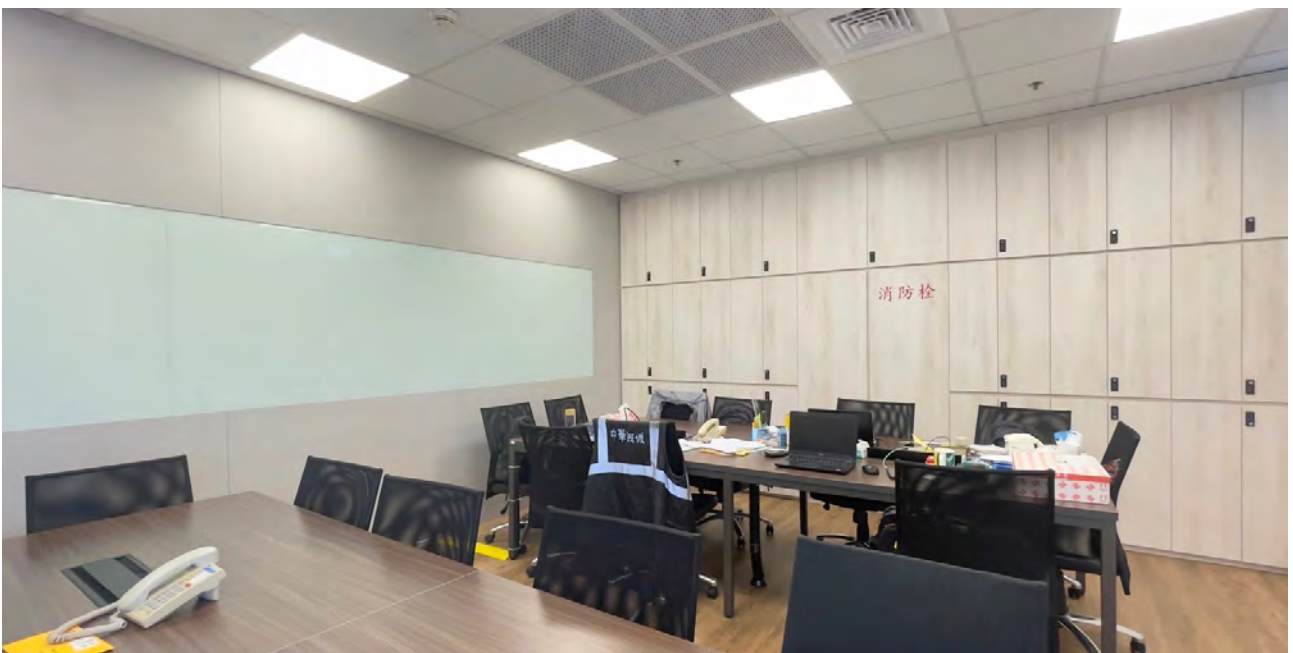

The clients hoped that the interior space can be divided into separate spaces for different departments. Considering the needs and job function of each department, the separated office rooms were created.

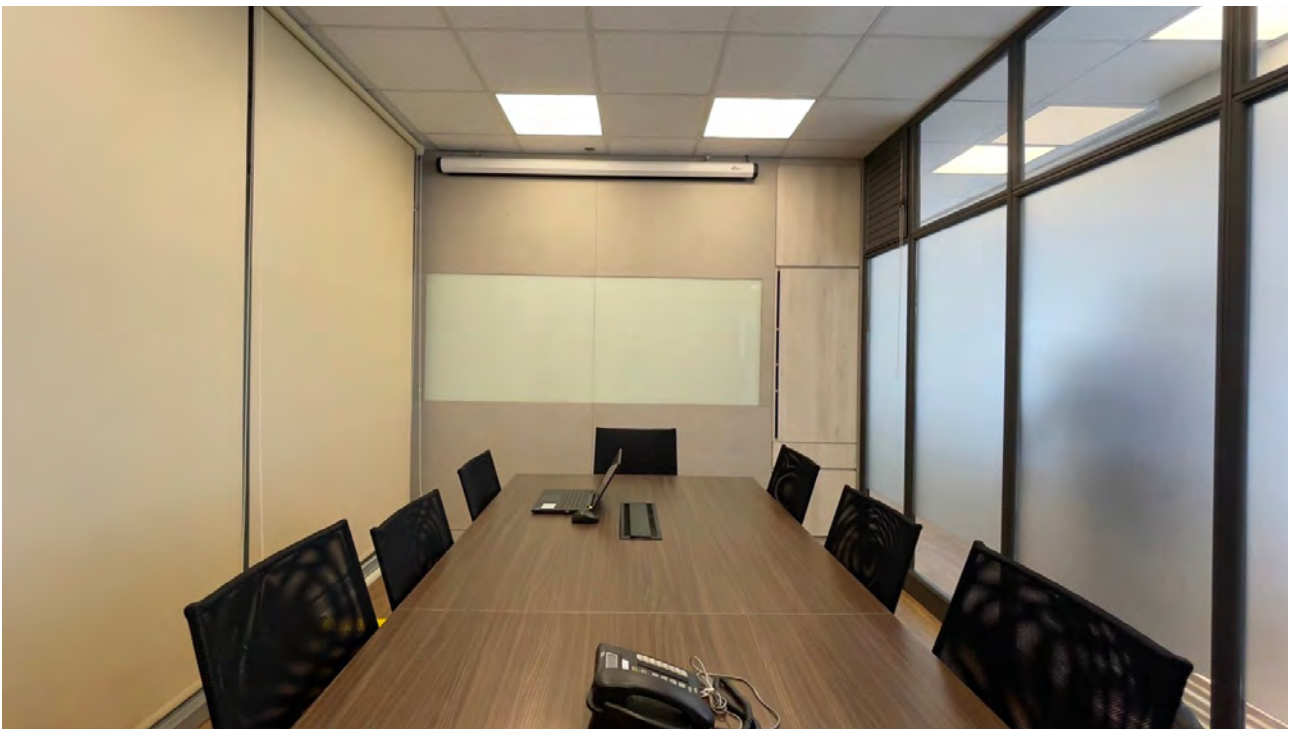

Since the designer was inspired by Tadao Ando's projects, the even surface, edge and corner anti-collision projection, symmetric segmentation, minimalist style were emphasized for this project to present the spaces.

Taking Tadao Ando's design principles as a starting point for construction, the designer laid particular stress on horizontality, verticality, right angle, and visual symmetry. By flattening surfaces, the designer prevented uneven wall surfaces and the seams that may result when placing storage cabinets.

The 2,847 square feet space includes general manager's office, supervisor's office, administrative office, sales office, meeting room, and pantry area. In the supervisor's office, the supervisors can communicate and manage various departments. In the administrative office, the administrative staff can report to supervisors and discuss with them in a short time. The sales office emphasized spatial flexibility, which provides the sales flexible use of space.

With edge details, line segmentation, and the technique for making the complex simple, office rooms were separated for each department, and the operational efficiency was increased through improving traffic flow in office.
