ABB and Enovate Upstream have signed a memorandum of understanding to apply their complementary digital platforms, ABB Ability Wellhead Manager and Enovate Upstream's Digital Production, to create a fully automated and scalable, digital oilfield solution.

The solution maximizes the value of assets by connecting operations and engineering through a cloud-based digital platform. The artificial intelligence technology gives customers the opportunity to understand their production to enable better decision-making while providing financial performance and capital management.

The ADA AI Digital Ecosystem created by Enovate Upstream and ABB Ability Wellhead Manager are cloud-based platforms that when integrated provide a comprehensive insight into onshore upstream production assets. This includes reservoir modeling, cloud-based supervisory control and data acquisition system (SCADA) and a mobile platform from anywhere, at any time, on any device.

"Our collaboration with Enovate Upstream enhances our capabilities in supporting their digital transformation," said Nathan Tungseth, ABB global segment manager for oil and gas. "Working together, we bring extra value to upstream customers with our production and operations solution. Customers using our combined capabilities gain more insight into the reservoir data to make more informed decisions."
