ANTIOXIDANT PROTECTION CONFIRMED

CAP-e testing validated the absorption and protection of Reserve in red blood cells from oxidative stress.

CAP-e Test Protocol: Reserve is dissolved in ethyl alcohol (water solvent) and PBS (non-water solvent). The red blood cells are put in the two Reserve solutions with a peroxy-free-radical generator (AAPH) and a fluorescent indicator dye. The amount of oxidative damage is measured by the change in the indicator dye. The results are then compared to the control (Gallic acid)*
