

Better Network Management with Utility GIS Solutions

Anglian Water manages a vast network that provides 1.2 billion liters of water a day to more than six million customers. The utility realized that without the ability to reliably share data across the organization, there was no way it could keep up with its expanding customer base and strict regulations.

With Intergraph G/Technology[®] from Hexagon Safety & Infrastructure, Anglian Water implemented a single, modern environment for all its map-based data and infrastructure records. Now the utility can:

- Improve network design and documentation, data accuracy, and workflows
- Reduce the number of incidents that occur
- Empower employees with data and tools to make better decisions

With its utility GIS solutions, Anglian Water now has control of its network data, and is using this data to its full advantage.

Discover how Anglian Water keeps the water flowing and customers happy with Hexagon technology.
