

We have successfully pushed an update to all instances residing in the United States, Canada and the European Union. This update aims to provide users an enhanced experience through optimization upgrades on their PC and on their Video Conference applications on Android 1.2.0 and iOS 1.1.0

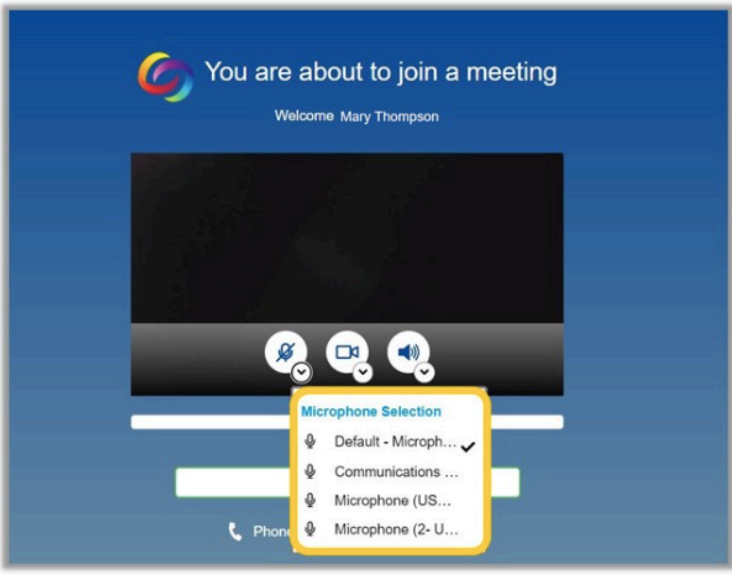

**1 Increased Number of Video Presenters**

We have successfully increased the maximum capacity of presenters that can participate in a Video Conference from twelve to sixteen (in addition to about 200 more non-video participants). This update will facilitate greater collaboration and allow for the easier sharing of ideas. We intend to further increase the number of presenters in future releases.

**2 Enhanced Microphone and Audio Selection**

Prior to joining a video conference, users can opt to join with their default microphone and speaker or choose from the connected sources available. The Video Conference also supports dynamic source switching during an active video conference, allowing users to make changes to their microphone and speaker source.

**3 Optimized Loading and Downloading**

We performed a webpack integration to reduce bundle sizes in order to allow for users to experience faster loading time and reduced memory storage.

**4 Update Reflected in Mobile Applications**

In order to provide mobile users the same enhanced experience, the Video Conference application has been updated, which entailed resolving minor bugs and making general improvements, to support this release.
