

# Ways of Learning

Contrary to the traditional educational way of learning, there is actually a diverse range of learning styles for every student. Schools generally use linguistic or logical learning styles, but other styles may be more effective for some learners. When students are not performing as well as they could be, they tend to search to be taught in a different way. Three of the most popular ways of learning are visual, aural and verbal.

One popular way of learning is visual, in which doodling, diagrams, flowcharts, graphs, and visual symbols are very present. There are students who find it very easy to understand a subject if it's in, for example, a diagram. Knowledge or concept maps are other great tools for visual learners as they can draw connections or use color coding to group ideas.

A second very popular way of learning is aural, which is a style in which individuals learn best through hearing directions and speaking answers. These learners depend on hearing the information to fully understand it, rather than just reading it from a book. Group discussions work very well for these types of students and they prefer to listen to lectures rather than take notes.

A third very popular way of learning among students is verbal, which refers to a person's ability to reason, solve problems, and learn using language; these types of learners usually possess a rich vocabulary. Verbal learners are naturally born speakers and find it easy to express themselves, both in writing and verbally.

To sum up, if you have a student that's struggling, uncovering their unique learning style could help you get them back on track. There are many factors that affect the learning process, including the environment, and cognitive and emotional factors. However, understanding your learning style can help you learn more easily.
