MEDIA KIT

3 Products To Help Prevent Deaths and Injuries Due To Accidental, Isolated and Mass Shootings

ShotBlock is the complete solution for total firearm safety. Its kits and software reassure human safety by automatically locking unsecured guns in safety zones while also locking down protected locations.

It works in three ways to prevent tragedies on personal and public levels:

- Our Firearm Safety Kit (FSK) keeps control of the firearm in the hands of the owner by setting trigger lock conditions.
- The Site Safety Kit (SSK) immediately locks down public sites through metal detection and FSKs breaching no-gun zones.
- The Enterprise Management Software (EMS) enables police and public authorities to quickly respond to zone breaches.

ShotBlock takes the public discourse around firearms away from contentious issues of supply and control and focuses public opinion on a universal objective: preventing gun-related harm.

The Firearm Safety Kit (FSK)

The Firearm Safety Kit (FSK) blocks the trigger from use of anyone other than the registered gun owner. Unauthorized use, movement or location of the firearm activates cell phone alerts AND AUTOMATICALLY LOCKS THE FIREARM TO RENDER IT INOPERATIVE until an authorized owner/user deactivates the FSK.

The Site Safety Kit (SSK)

US patent pending

FSK

EMS

Site Safety Kit

Sensor & Data Communication Device

Installation Location

Any building or area uses the same equipment

SSK Block Box

Data communications, alarms, & lock downs

Metal Block

Detects metal and sends data to Block Box

No-Gun Zone Breach

Automatically Close/Lock
Doors, Gates and Barriers

Medium/Long-Range Devices

LoRaWAN Gateways (2km)
Geofences (15 feet - 8000 miles)

The Site Safety Kit (SSK) provides automated security for sites such as schools, campuses and municipal buildings. The SSK Block Box detects a breach of the protected perimeter by unauthorized metallic objects. For No-Gun Zones, the SSK automatically closes and locks doors, gates and barriers. The system will also sound alarms and initiate lock downs while simultaneously communicating with municipal response teams.

Site Safety Kit

Sensor & Data Communication Device

Close-Range Devices

RF Transmitters, RFID Readers
Sensors, Beacons, Metal Detectors

Enterprise Management Software (EMS)

US patent pending

The Enterprise Management Software (EMS) works in concert with the SSK to detect and secure locations, notify authorities, lock down sites and implement on-site safety protocols through automated data communications.

By working seamlessly with the FSK and SSK, the EMS is the final step in the ShotBlock trio of products that will provide unparalleled protection from accidental, isolated and mass shootings.

Our Team

The ShotBlock trio of products is produced by TalkKnowledge, LLC, a technology integration and development company founded by inventor and entrepreneur Chris Baker in 2005.

Chris Baker - CEO

Chris Baker has over 40 years' experience as an inventor, systems technologist, firearms enthusiast, program manager, property manager, community service volunteer, systems and computer engineering architect and entrepreneur. He is the founder and owner of Talkknowledge, LLC.

A native of Nashua New Hampshire, Chris graduated from San Jose State University (SJSU) with a Bachelor of Science degree in Physics. Because he also excelled in computer component integration and electronics, Chris was hired by DoD contractor Lockheed Martin Corporation (LMC) in 1984 while still attending SJSU. At LMC, he first operated and maintained digital and analog satellite ground communication systems for the Air Force Satellite Control Network (AFSCN).

He was then promoted to Chief Engineer where he designed, architected and implemented the world's first Asynchronous Transfer Mode (ATM) over satellite DoD system that was globally deployed and is still in use today to serve warfighters around the world. After his retirement from LMC in 2013, Chris saw the need to address the danger of accidental and mass shootings. He started inventing a method to manually or automatically deactivate firearms upon detection of their unauthorized motion, use, environmental conditions, proximity and location. This became the ShotBlock system.

Len Goodman - CFO

A former airline pilot for TWA, Len Goodman went on to become CEO of Hammel Corporation and Director of IT Flight Operations for AirTran Airlines. He is a Certified Business Analyst, CFO, and Registered Investment Advisor.

For over 25 years, Len has served as a top level management consultant. He is the author of numerous published articles and three books: "The Meldtdown Chronicles," "Ez Accounting for Contractors," and "How to Analyze an SME."
