

6 Ways to Manage Demurrage and Detention

A Shippabo Playbook

Shippabo is a global logistics and inventory management platform. Teamed with machine learning and an expert logistics team, Shippabo gives control back to importers with real-time tracking, product visibility, partner integration, and centralized communications.

Introduction

As global shipping technology improves, supply chain managers will find themselves with more influence over their inventory from port to warehouse.

Even now, logistics teams using Shippabo find themselves in better positions to strategically manage detention and demurrage. By executing certain cost-saving tactics, they can keep their shipment timelines on track and more money in their pockets.

Centralization

Bringing your supply chain process online is a quick and easy way to create shipment visibility and streamline your entire operation.

Add your team, supply chain partners, and anyone else to the platform. Communicate with your network, track shipments and send data, and keep in touch with Shippabo's Operations Team.

All this directly impacts your ability to strategically plan and mitigate demurrage and detention fees.

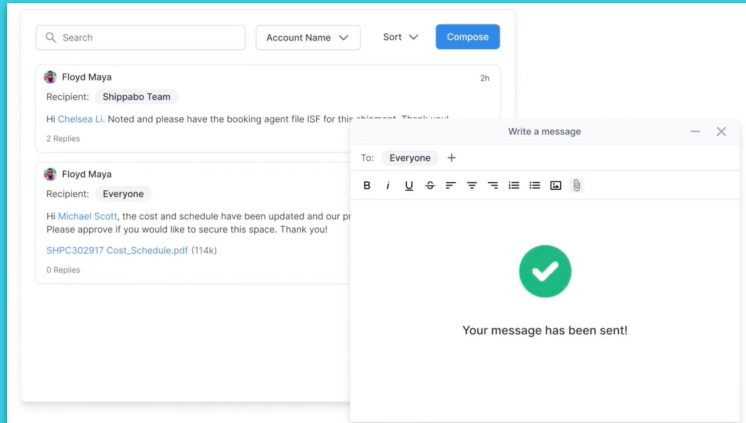

Communication

Shippabo streamlines communications with your entire network, keeping looped in and allowing for pivots that will help avoid additional fees.

For instance, users can be plugged in with Shippabo's Operations Teams to make strategic adjustments – paying for more free days in advance, using carriers with better free-time terms, finding off-dock storage solutions – and building and adjusting a plan that is cost-efficient and timely.

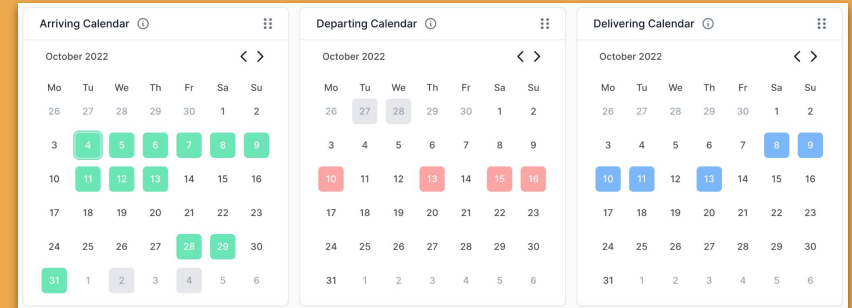

Container Tracking

Shippabo's platform allows users to track shipments, containers, and products.

When it comes to reducing detention, container tracking is key. Knowing when exactly containers will be unloaded, identify any container bunching, and start transiting to their final destination will allow you to communicate with warehouses to plan for the delivery, ensuring live deliveries and reducing the possibility of running out of free days.

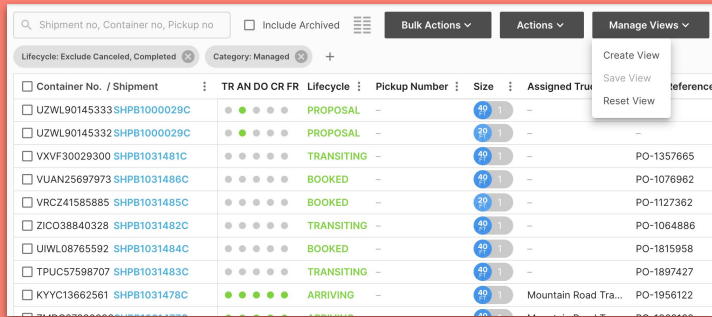

Custom Views

Speaking of free days, these are easily tracked in Shippabo.

Shippabo enables users to build Custom Views that automatically track the last free days for their containers. These views can be turned into reports that and sent out to your network so everyone is kept in the loop.

Knowing when free days will expire allows teams to pre-plan how they're going to move their containers from port to delivery and back.

The screenshot shows the Shippabo interface with a table of container shipments. The table has columns for Container No., Shipment, Lifecycle, Pickup Number, Size, Assigned Truck, and Reference. A dropdown menu is open over the 'Manage Views' button, showing options: Create View, Save View, and Reset View.

Documentation

Telex and customs releases, commercial documents – having all these ready to go is incredibly important for keeping your shipment timelines on track. Delays in documentation will lead to delays in moving your containers. These delays become especially impactful when it comes to availability to move them from the port and can lead to an expiration of your free days.

That's why Shippabo's platform tracks documentation so you can check and see what is needed. Our Operations Team also works closely with you to help manage this process.

Partner Input

Your transiting partners can help you optimize your containers' journey and reduce added fees.

Truckers, for instance, are an invaluable part of the supply chain process and an invaluable resource for strategic planning. At Shippabo, we streamline the delivery process through sharing receiving availabilities and booking deliveries for importers. We also work with truckers to gather a lot of important, cost-reducing data: ports not accepting empty containers, unviable routes, understaffed warehouses.

Trucking Quoted ↓ ⋮	Trucking Invoiced ⋮	Container Count
\$1,150.00	\$0.00	2
\$1,090.00	\$1,090.00	1
\$1,060.00	\$1,060.00	1
\$1,030.00	\$1,030.00	1
\$930.00	\$930.00	1
\$860.00	\$860.00	1
\$600.00	\$600.00	1

Conclusion

The future of global shipping is in providing more control to importers. Better visibility, better tracking, better communication, better recommendations – all this will help give businesses more control over their inventory as it moves from port to warehouse.

Using Shippabo, users can centralize communication, optimize planning, and track containers, driving down additional costs associated with detention and demurrage, and improving their bottom line.
