

SBAR - Blood Product Transfusion Reaction

Introduction: Your name, Position, Unit	Hi Doctor, it is Nurse Amanda from unit Postpartum..
Situation: Patients name, age, specific reason for the visit	I am calling in regards to Marissa Grant, 40 F. She is currently getting a blood transfusion and has developed a rash on both arms. Her admission date was...
Background: Patients primary diagnosis, date of admission, current orders for patient	She is receiving this blood transfusion due to a postpartum hemorrhage resulting in low hemoglobin of 64 g/L. She delivered vaginally approx. 1.5hrs ago. The blood transfusion is currently on hold and had been running for 15 minutes before reaction was noted. She is ordered to receive one unit PRBC over 2 hours. Currently a 0.9% NS bolus is being infused..
Assessment: Current pertinent assessment data using head to toe approach, pertinent diagnostics, vital signs	Her current vitals are HR 104, BP 90/64, Spo2 96% RA, RR 19 and temp 37.3. She remains alert and oriented. She reports no respiratory issues, Lungs sounds clear in all quadrants and no N&V reported. Rash is localized to the arms and has not spread.
Recommendations: Any orders or recommendations you may have for this patient	Do you want benadryl to be administered? Do you want NS to continue to be infused?
