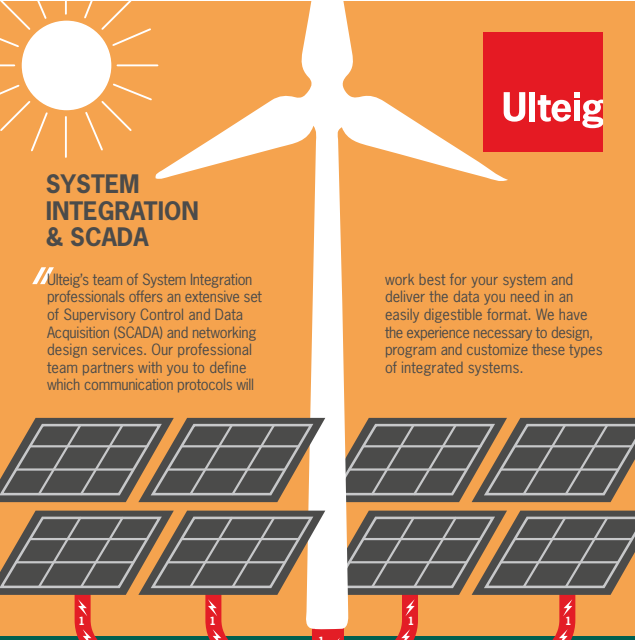
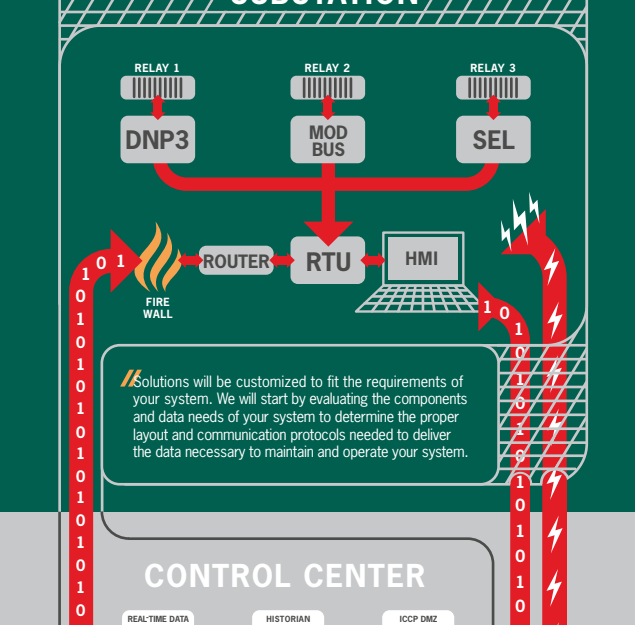
Ulteig

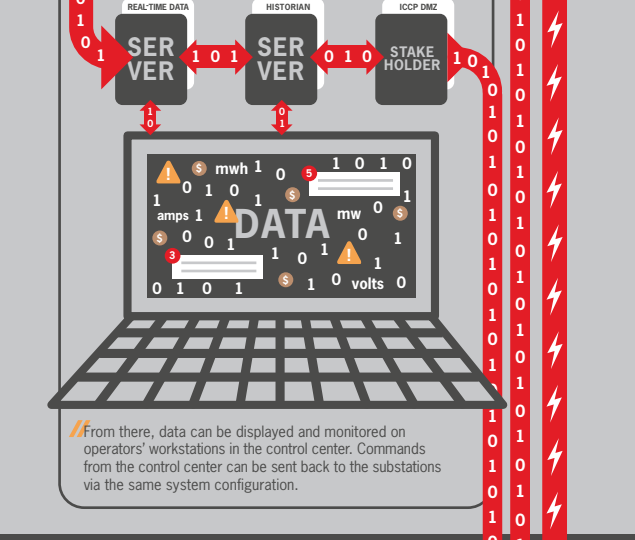
SYSTEM INTEGRATION & SCADA

Ulteig's team of System Integration professionals offers an extensive set of Supervisory Control and Data Acquisition (SCADA) and networking design services. Our professional team partners with you to define which communication protocols will work best for your system and deliver the data you need in an easily digestible format. We have the experience necessary to design, program and customize these types of integrated systems.



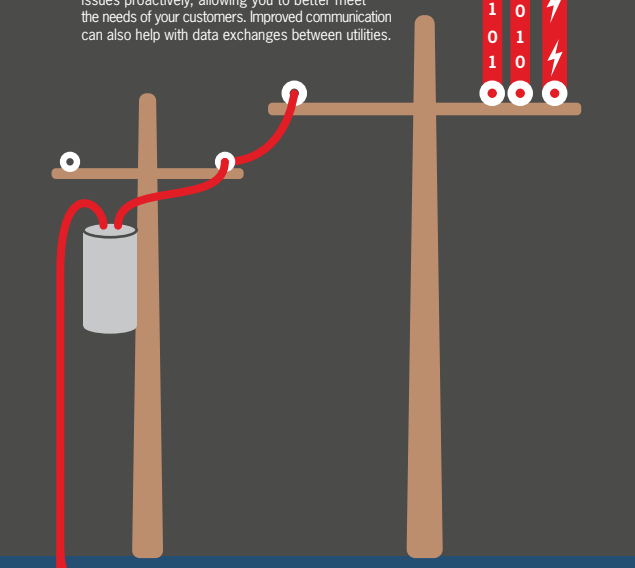


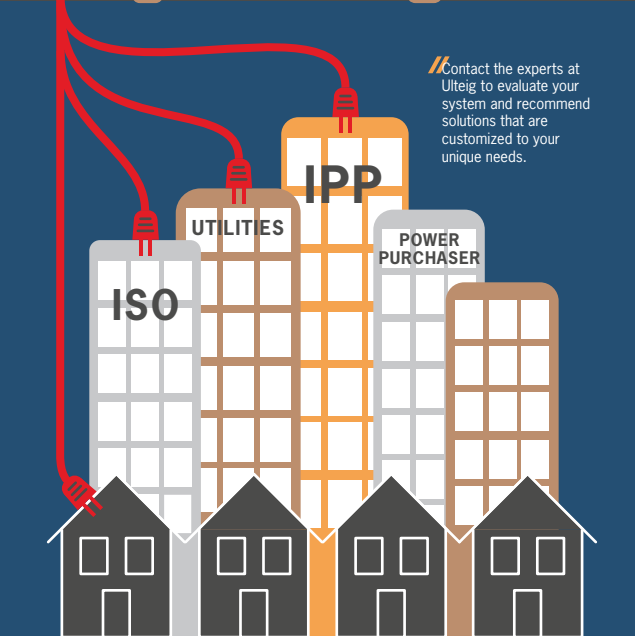
Solutions will be customized to fit the requirements of your system. We will start by evaluating the components and data needs of your system to determine the proper layout and communication protocols needed to deliver the data necessary to maintain and operate your system.



From there, data can be displayed and monitored on operators' workstations in the control center. Commands from the control center can be sent back to the substations via the same system configuration.

These types of upgrades can help you resolve outages more efficiently and identify potential issues proactively, allowing you to better meet the needs of your customers. Improved communication can also help with data exchanges between utilities.





Contact the experts at Ulteig to evaluate your system and recommend solutions that are customized to your unique needs.
