The Sioux Energy Center has mined 20 Bitcoin in secret since April

Latest News Published Oct 25, 2021

The environmental impacts of the site were quickly called into question following the reveal.

[Copy link](#)

Electric services provider Ameren Corporation announced Monday that it has successfully mined upward of 20 Bitcoin (BTC) using excess energy generated by one of its coal-based power plants — the Sioux Energy Center in West Alton, Missouri.

While the company set up the data center used to mine the coins back in April, it did not publicly announce the addition until Monday. Its half-megawatt mining facility taps into the Sioux Energy Energy Center's 972 MW generation capacity to complete the necessary proof-of-work-based mining activities.

Ameren's goals in launching the operation appear to have been to stop a decline in the power plant's energy generation and to provide the company with a new revenue stream. When mining began in April, the power plant was allegedly running at a mere 17% of its full capacity.

Following the announcement, the company's environmental impact was quickly called into question. In February, an alliance of three environmental groups — the Waterkeeper Alliance, Missouri Confluence Waterkeeper and Great Rivers Environmental Law Center — [announced](#) it intent to file suit against the company for violating the Federal Clean Water Act.

"They (Ameren) have responded and we are evaluating our options," said Bruce Morris, an attorney with the Great Rivers Environmental Law Center.

The Sioux Energy Complex, which sits on farmland near the banks of the Mississippi River, is alleged to store over 3 million tons of coal ash in an unlined storage pit. The environmental groups have [urged](#) management at the Sioux Energy Complex to remove the coal ash storage pit in the past, but to seemingly limited avail.

Ashtracker, the Energy Integrity Project's energy pollution data-reporting site, has also stated that of the 29 water monitoring wells surrounding the plant, 15 are polluted above federal advisory levels for molybdenum, boron, sulfate, lithium and cobalt.

Although the utility did [complete](#) a \$600-million plan that upgraded the plant with the latest environmental controls back in 2010, Ameren's mining operation appears to go against much of the industry's views on how companies in the space should approach their environmental footprint. Everyone from Elon Musk to the crypto derivatives trading platform BitMEX have pledged to do their part to make mining a less resource- and energy-intensive endeavor. Sam Tabar, chief strategy officer of Bitcoin miner BitDigital, has said that the use of carbon-neutral energy sources is integral to improving sustainable practices and mitigating the industry's environmental impact.
