

# There's just one conclusion: it works.

## *It works for you and for your patients.*

With the Pioneer Sternal Cable System, there is little reason to worry about sternal rewiring down the road.

### **Strong**

Our cable is ten times stronger in fatigue strength than standard sternal wire and provides a secure and uniform closure.

### **Consistent**

Our patented tensioning system permits you to adjust the tension of the cable to a known value, allowing for consistency in pressure along the midline.

### **Flexible**

Our sternal cable uniformly hugs the bone and lessens the possibility of loosening, micro movement, potential postoperative implant failure and related patient risk.

### **Reliable**

The strength of our cable and the method of attachment, coupled with the ability to achieve consistency in tension, makes our system reliable.

### **Easy-to-use**

Because of its strength and flexibility, only three or four cables are required to close the typical sternum, instead of six to eight strands of monofilament wire.

### **Proven**

Surgeons world-wide agree that the strength, flexibility and rapid application of the Pioneer Sternal Cable System makes their job easier. Available in Titanium or Stainless-Steel.
