

From the office of Mav Turner,
Chief Technology Officer, DevOps

Hello Tricentis colleagues,

The Tricentis Tosca 2023.2 release is here! This release marks a significant leap in test automation with advanced self-healing and accessibility testing features.

Our new Tosca Accessibility Report allows users to identify and address accessibility issues in web applications, instantly providing insight into which objects, images, and components of your app have critical errors. Tosca's user interface has also been revamped for enhanced accessibility, meeting Section 508 compliance.

Changes happen frequently in enterprise applications, which is a headache for testers who need to manually update existing modules in their test suite with every change. To address this, we've extended our self-healing functionality for both Oracle Fusion and Salesforce apps to automatically identify and update affected modules, streamlining the process and reducing errors.

Other key enhancements

- **State-of-the-art SAP automation:** Tosca leads the way in SAP automation, supporting *all* the latest SAP UI5/Fiori versions. This enables robust SAP automation, ensuring your workflows are resilient to changes.
- **Tosca / SAP Solution Manager integration:** Now users can automatically trigger test executions from SAP Solution Manager UI, making it possible to automatically run your SAP tests in your CI/CD pipelines across any SAP application and version.
- **Enhanced Tricentis qTest / Tosca integration:** We're excited to introduce a significantly simplified and enhanced setup process for integrating qTest with Tosca. Now, all necessary settings are consolidated into a single, dedicated tab within the Tosca Settings menu, eliminating the need for navigating multiple pages. We've automated several steps in the integration process, with the Notification Service being enabled by default. We've also added curated hints directly on the configuration page, guiding users through the Tosca setup with ease. These improvements deliver a more user-friendly setup experience, greatly enhancing productivity and overall user onboarding.
- **Tosca Mobile automation enhancements:** Tosca users can use local and cloud devices running on iOS 17, with continuous support for upcoming major OS releases of iOS. We're also happy to announce that Tricentis Mobile Agent now supports running iOS tests in parallel.
- **Improvements to Distributed Execution (DEX):** This update enhances DEX Agents' efficiency by enabling immediate test execution without delays when results are transmitted and imported. Additionally, DEX Agents can now reconnect to the server after crashes for uninterrupted operation. A new early access feature introduces multiple AOS workspaces for parallel result importation, significantly boosting scalability. These improvements greatly enhance DEX/AOS's stability and reliability.
