Mossy Earth Announces Plans to Expand to North America

City, State— Mossy Earth, a nonprofit rewilding and conservation organization based in Europe, is seeking to expand its operations in North America to address damaged ecosystems impacted by natural disasters and human activity in efforts to combat climate change and animal species extinction.

Mossy Earth’s expansion comes at a crucial moment as the U.S. faces increasing challenges from wildfires and water shortages. In 2020, one of the largest wildfires in U.S. history devastated California, Oregon, and Washington state, displacing communities and damaging vital ecosystems. And as the U.S. makes a steady change towards clean energy systems, many forests and valleys are still ravaged by both current and historic mining for resources like coal and metal that leave the landscape damaged for decades. Mossy Earth aims to assist in the recovery of these kinds of landscapes by restoring ecosystems lost to wildfires, mitigating climate change, and supporting biodiversity.

Through reforestation, flood prevention, and habitat restoration, Mossy Earth’s projects can help heal the land and reduce the climate impact of damaged ecosystems. By bringing their expertise to North America, the organization seeks to create long-lasting environmental solutions that protect both nature and communities.

To help Mossy Earth in their expansion into the U.S., consider contributing by donating online or supporting their work by offering to volunteer in these rewilding projects at www.mossy.earth. Together with Mossy Earth, we can help the necessary steps to restore America’s wilderness and protect the environment for future generations.
