

What is Delta-8 THC?

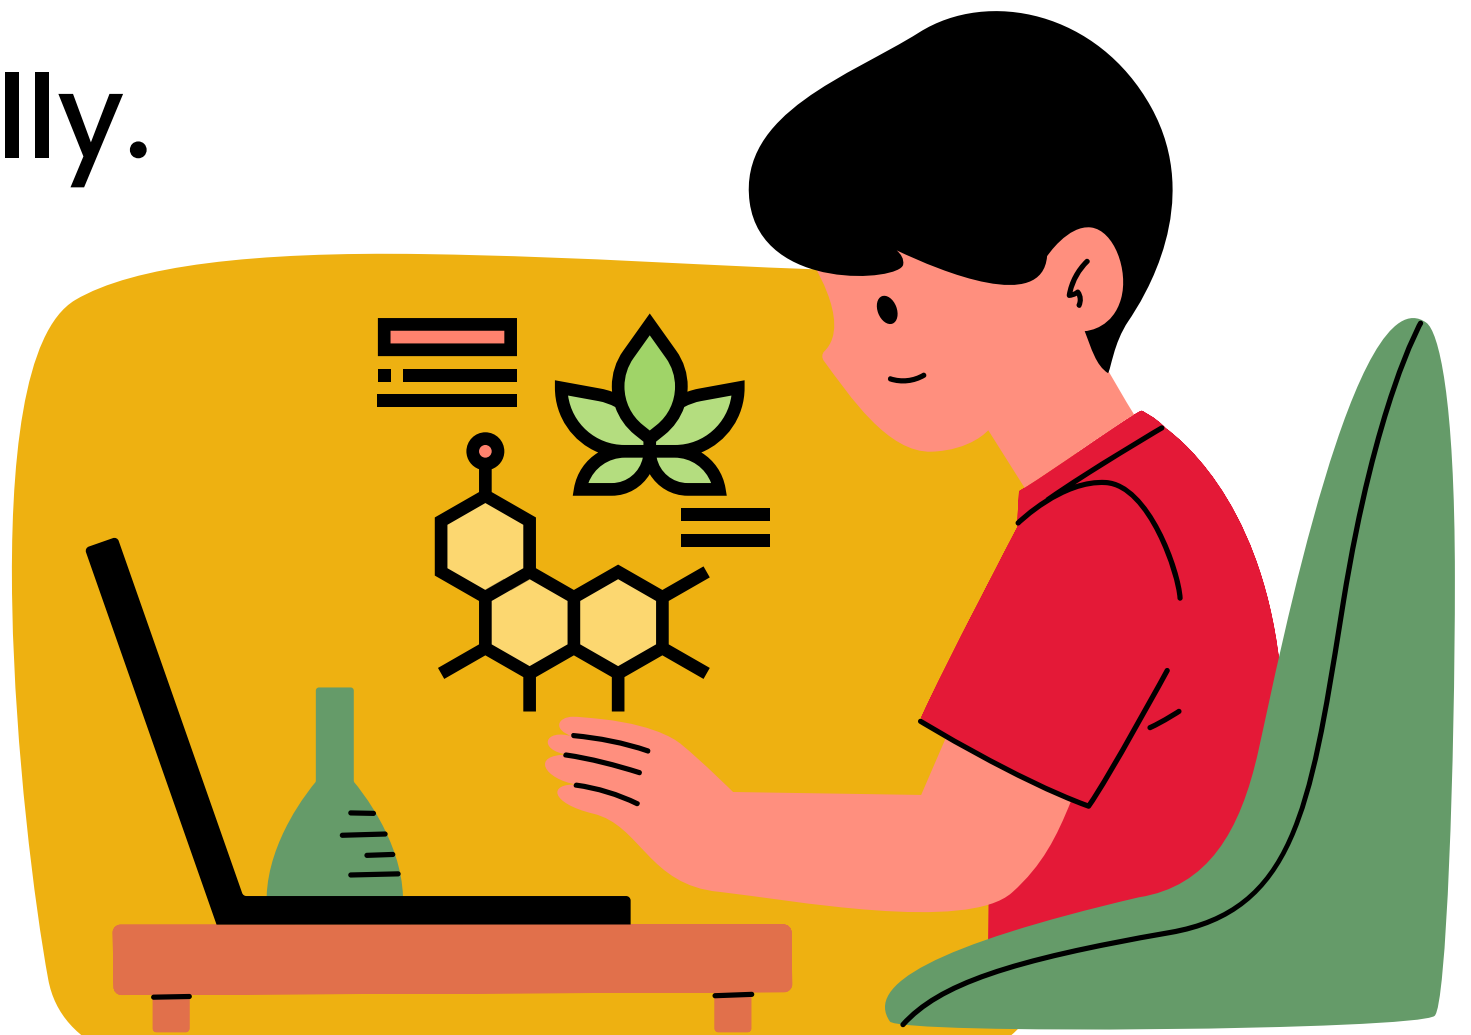

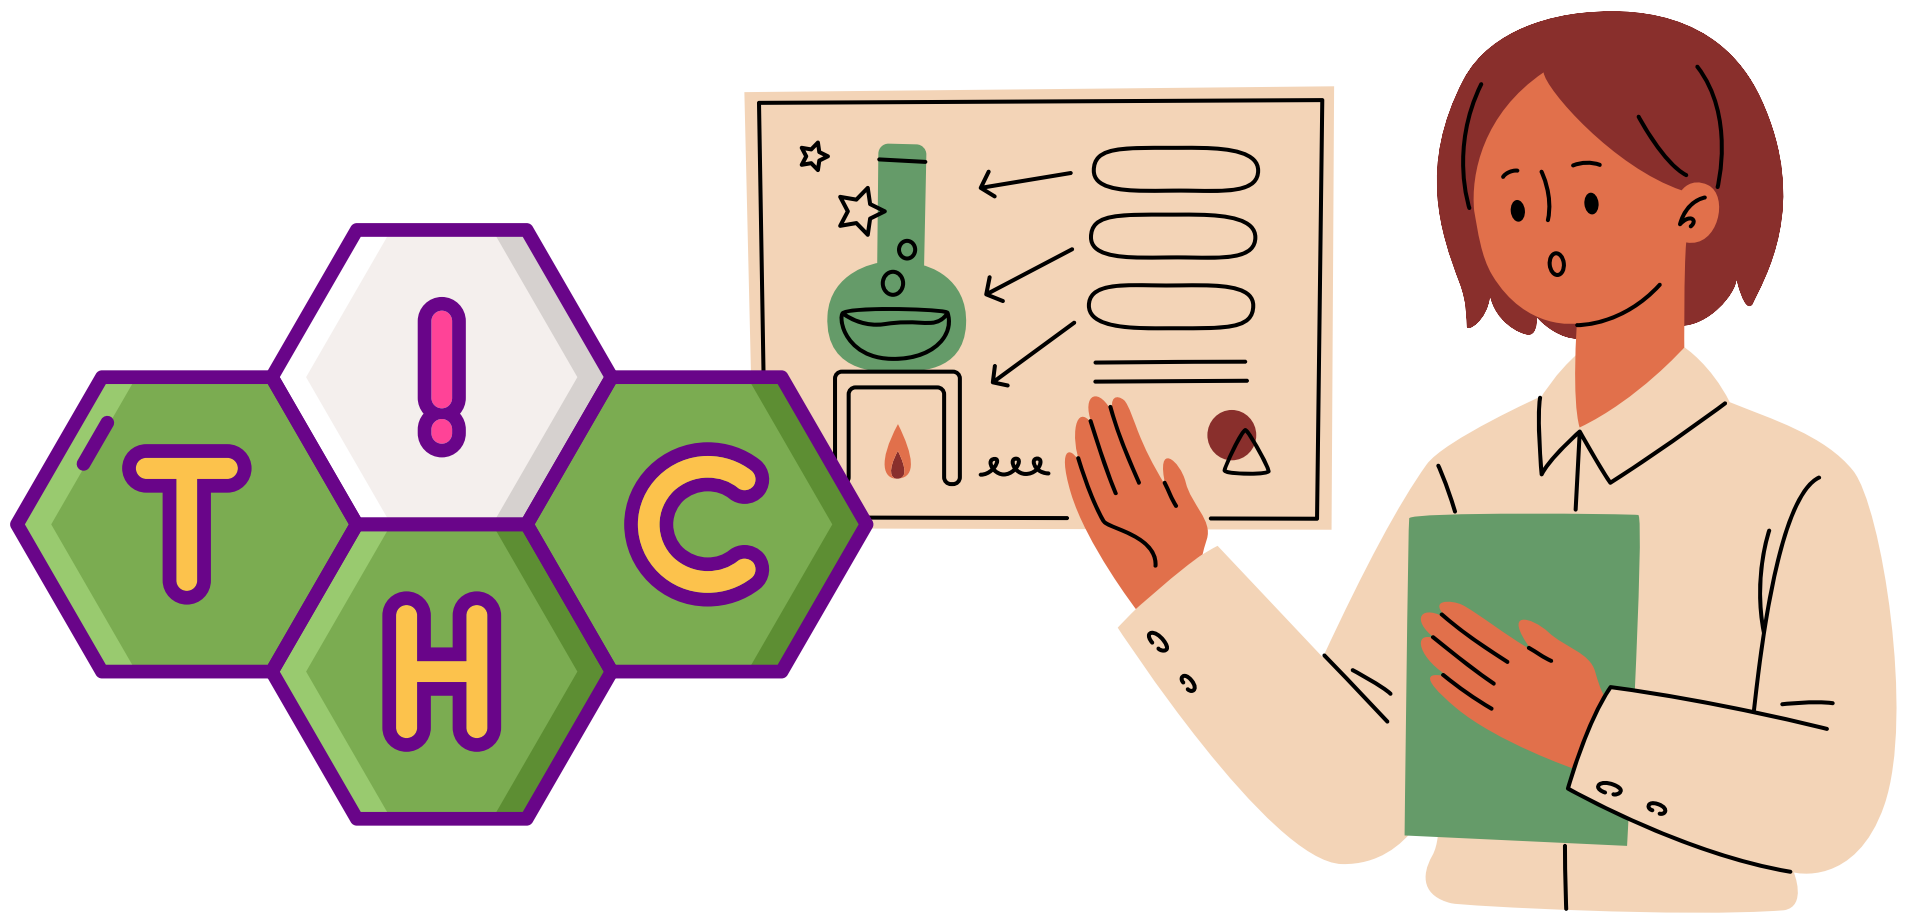

Delta-8 THC

is an **isomer** that naturally occurs in hemp plants in small concentrations.

It is **synthetically converted** through isomerization with **solvents, acid, and heat** to produce higher concentrations of delta-8 THC than those found naturally.

The resulting products are a much higher-level **psychoactive** with side effects very similar to **delta-9 THC**-- the type found in marijuana sold legally in many states.

The **problem** is that due to the definition of hemp in the national 2018 Farm Bill, this type of THC is **unregulated**.

Because there are **no age restrictions or safety regulations** surrounding these products, consumers are getting hurt by ingesting products that are not safe, and kids are accidentally eating products they confuse for other foods.

**We can
change
this.**

By clarifying the definition of hemp in the [upcoming 2023 Farm Bill](#), we can put a stop to the unregulated "gray market" of delta-8 THC.

We can make sure Delta-8 THC and other isomers are recognized as psychoactive and not legal hemp.

**Tell your lawmakers to
clarify the definition of hemp
in the 2023 Farm Bill.**
