Advanced Renewable Energy Reporting: Prove ROI with Confidence

As renewable energy becomes a growing part of corporate energy portfolios, the pressure to prove its return on investment is mounting. Before approving new capital projects or PPAs, financial decision-makers must understand the financial performance of existing assets and contracts. For energy teams, this often requires stronger processes to report renewable energy performance.

Traditional reporting methods typically fall short. Without access to structured and audited energy and utility data, corporate energy teams often depend on internal benchmarks that do not fully capture avoided costs.

During this webinar, the key topics that will be discussed are:

- Market challenges and the case for accelerating renewable energy programs (OBBA)
- Why reporting benefits of existing programs is an important tool to unlock budget/capital
- Common challenges we see with DER, Comm Solar, and VPPA management
- Case studies of improved reporting

Gain an understanding of how a more integrated approach between renewable advisory and bill pay services can improve accuracy, transparency, and confidence in renewable energy financials.
