# 3 ESSENTIAL TIPS FOR PROPER FILTER REPLACEMENT

**SUPERIOR**  
WATER & AIR

# CHANGE AIR FILTERS REGULARLY

- Dirty filters restrict airflow and make systems work harder.
- Reduced airflow lowers heating and cooling efficiency.
- Clean filters help remove dust, allergens, and pollutants.
- Check monthly during heavy-use seasons.

# REPLACE WATER FILTERS BEFORE THEY CLOG

- Clogged filters reduce water pressure.
- Old filters stop removing contaminants effectively.
- Delayed replacement can strain your system.
- Follow recommended replacement timelines.

# WATCH FOR PERFORMANCE CHANGES

- Weak airflow from vents.
- Drop in water pressure.
- Strange odors or stale air.
- Systems running longer than normal.
