H1: Why Bee Removal in The Woodlands, TX?

Bee Man Dan in The Woodlands, TX, delivers trusted and thorough beehive removal for any location. Our bee removal professionals are highly trained and well-equipped to help locate and relocate beehives, swarms, or colonies that pose as a threat to your family, pets, and home.

At Bee Man Dan, we are aware of how beneficial bees are for the environment and ecosystem in The Woodlands. However, bees become troublesome when they establish a nest in your home and cause damage to your property. Instead of simply destroying the hive and losing the ecological benefit bees offer, we'll relocate the hives, preserving the bees and their habitat.

H2: Our Bee Removal Process

To begin, our bee removal specialists first find the location of the infestation, and examine the size and damage caused by the hive. Through using our advanced FLIR technology, we are able to view the full image of an active hive at its definitive location. For more concealed structures surrounded by walls or other enclosed interiors, we use our borescope or stethoscope to see and hear hives with precision and accuracy.

During the bee removal, we do not use any pesticides or dangerous chemicals that could cause damage to your property or family. Instead, we carefully remove the bees and hives before relocating them to our local nursery apiary. We work to fully remove the hives, bees, and any other residual matter, as an unoccupied and decaying hive may attract pests or damage property further.

Lastly, we'll coat the vicinity with an environment-friendly repellent to help ward off other swarms from overstaying their welcome on your residence.
