

Product Improvement

Predictive Maintenance

Through predictive maintenance, companies can obtain a lot of useful information, including foreseeing the breakage of a component.

With this data, it is possible to intervene in advance and avoid emergency operations that often means downtime to the customer, also giving the products a huge competitive advantage.

Internet of Things

We can connect and make intelligent almost any type of product.

The latest technologies allow us to choose different types of connectivity according to needs. By integrating low-size, low power, and low-cost microcontrollers, we can make products belonging to different categories and sectors „smart“.

Business Intelligence

Through connectivity, it is possible to obtain important data about the consumers' usage of products for one particular product or the statistics of longer periods or various products.

Data can be analysed for reducing the costs of warranty replacement due to breakages or to improve the commercial offer based on how customers use the product itself.

ABOUT US

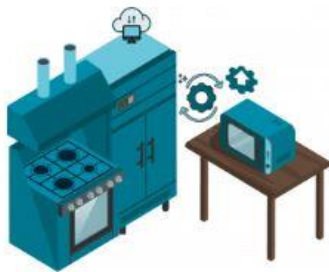

Who We Are

Based in “the Silicon Valley of Northern Europe”, Qwyddy Technologies is founded on a passion for innovation. Managed by an interdisciplinary team with decades of professional experience in information technology, electronics, and mechanics, our company associates the experience and tradition with the upcoming technologies.

Mission

Our Mission is creating projects capable of engaging people through experiences, digital products, and services. By way of technology, we are determined to support our customers to be at the leading edge of technology and contribute to creating a more connected, cleaner and hospitable world to live in.
