Dear Mr. Acustomer,

How much value do you place on the performance of your company's systems, applications, and databases? Putting a price tag on performance may be difficult, however pricing out the expenses of system failures can be daunting. Moreover, the effects of unplanned system failures can hinder your ability to remain open for business.

Many IT-savvy companies have fail-safes in place for malfunctions of mission critical systems and applications. However, this type of infrastructure can increase in cost and complexity, and doesn't detect performance abnormalities until a malfunction occurs. As a result, this can increase man hours spent identifying the root cause of irregular performance issues and lose customer confidence. To sustaining peak business productivity, the image, and reputation of your company, you must have real-time performance monitoring.

The **Real-Time Solutions for Distributed Environments** is a suite of performance and availability monitors used in real-time to monitor, detect, analyze, and resolve problems that can threaten critical business services. The benefits include:

- Real-time monitoring of systems and applications status, which allows your company to maintain, meet, or exceed service level agreements
- An integrated set of solutions for monitoring the status of all the subsystems running, which gives a complete view of your IT environment in a single window pane
- Quick return on investment with fast, easy installation
- The Universal Agent that provides a monitoring solution for almost any IT resource

For more details, please view <business partner landing page URL>. Please call me at xxx-xxx-xxxx if you would like details on how the Real-Time Solutions for Distributed Environments Solutions can improve your business.

Sincerely,

Mary T. Partner
